TA

To be added

Acknowledgments

The course structure is based on Compilers: Principles, Techniques, and Tools by Aho, Sethi, Ullman and Lam (2nd Edition).

Acknowledgments

The course structure is based on Compilers: Principles, Techniques, and Tools by Aho, Sethi, Ullman and Lam (2nd Edition).

Slides are based on the slides of the late Prof Sanjeev K Aggarwal.

Learning from this course

- Course has theoretical and practical components. Both are needed in implementing programming languages. The focus will be on the practical application of the theory.

Learning from this course

- Course has theoretical and practical components. Both are needed in implementing programming languages. The focus will be on the practical application of the theory.
- Emphasis will be on algorithms and data structures rather than proofs of correctness of algorithms.

Learning from this course

- Course has theoretical and practical components. Both are needed in implementing programming languages. The focus will be on the practical application of the theory.
- Emphasis will be on algorithms and data structures rather than proofs of correctness of algorithms.
- Theory of lexical analysis, parsing, type checking, runtime system, code generation, optimization

Learning from this course

- Course has theoretical and practical components. Both are needed in implementing programming languages. The focus will be on the practical application of the theory.
- Emphasis will be on algorithms and data structures rather than proofs of correctness of algorithms.
- Theory of lexical analysis, parsing, type checking, runtime system, code generation, optimization
- Techniques for developing lexical analyzers, parsers, type checkers, run-time systems, code generators, and optimization.

Learning from this course

- Course has theoretical and practical components. Both are needed in implementing programming languages. The focus will be on the practical application of the theory.
- Emphasis will be on algorithms and data structures rather than proofs of correctness of algorithms.
- Theory of lexical analysis, parsing, type checking, runtime system, code generation, optimization
- Techniques for developing lexical analyzers, parsers, type checkers, run-time systems, code generators, and optimization.
- Students will be confident that they can design, develop, understand, modify, enhance, and maintain compilers for (even complex!) programming languages

Course Structure

Relative Weight

Project	25
Class Participation	10
Mid-Term Evaluation	20
End-Term Evaluation	45

Project Detail

- Group of 4

Project Detail

- Group of 4
- Implement end-to-end toy compiler

Project Detail

- Group of 4
- Implement end-to-end toy compiler
- Each group has to choose a source, intermediate, target, and implementation language.
